Before you start

This manual describes the day-to-day use of **Dr Trade Scalper Pro** once it is installed on your MetaTrader 5. If you haven't completed the installation, follow the *Installation Guide* first (provided in the same delivery package).

i This document explains **how** to use and configure the robot. It does not detail the internal algorithms (intelligent cleanup, anti-trap filters, multi-strategy logic) which remain proprietary.

Quick prerequisites

- MetaTrader 5 installed and connected to your broker account.
- Auto Trading enabled (green button in the MT5 toolbar).
- **DrTradeScalperPro.ex5** placed in *MQL5/Experts/*.
- Demo or live account with sufficient balance for the configured lot.

■ What's new in v1.23

Version 1.23 brings 5 major improvements over v1.21:

- **New strategy CRT (Candle Range Theory)** — a 4th engine dedicated to liquidity sweeps on M5. It exploits false breakouts to catch reversals after stop hunts. Can be enabled standalone or alongside the others.
- **Compound-friendly QTP** — the Quick Take Profit automatically adapts to the lot size when compound interest is active: the equivalent pip distance stays constant whatever the adjusted lot.
- **Daily Profit Target** — set a daily profit goal; once reached, the robot stops opening new trades until midnight. Automatic Telegram notification.
- **Friday Auto-Pause** — automatic shutdown on Friday from a configurable GMT hour (e.g. 3pm GMT) to avoid weekend gaps. Auto-resume on Monday.
- **Unified Relay cascade** — priority YAO → STOKY → MCB → CRT. A strategy only blocks the ones below it in the hierarchy when it has an active trade; otherwise, the next one takes over naturally.
- **■ Master / Slave Copytrading** — new section allowing automatic trade duplication between a master account and N slave accounts on the same VPS. Group isolation via « Pairing Key » (unique group code). IDENTICAL or INVERSE modes, IDENTIQUE or LOT_LOCAL lot adaptation. See section 21 of the Configuration Panel Guide.

Installing the robot on MetaTrader 5

After payment, you receive an **.ex5** file by email (sometimes wrapped in an **.exe** installer). **First, save this file in any folder of your choice** (e.g. your *Downloads* or *Documents* folder). Then choose one of the two installation methods below.

Method 1 — Quick (first install)

Recommended if this is your first install.

- **Double-click** the **.exe** file received by email.
- MetaTrader 5 opens automatically and the robot is placed inside the correct *MQL5/Experts/* folder.
- The robot appears immediately in *Navigator* → *Expert Advisors*.

Method 2 — Alternative (update or renewed license)

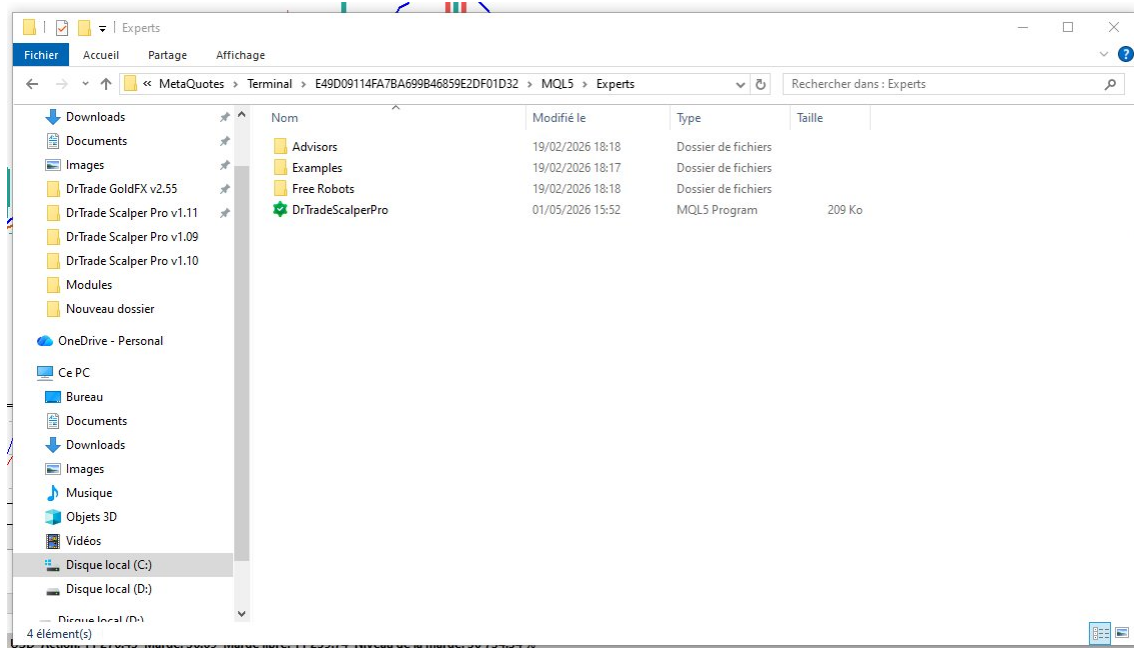

Use this method when you install a new version or renew your license.

- **Right-click** the **.exe** file and choose *Copy*.
- Open MetaTrader 5.
- From the **File** menu, click **Open Data Folder** (shortcut *Ctrl + Shift + D*).

MT5 — File menu → Open Data Folder

- In the window that opens, enter **MQL5** → **Experts**.
- **Right-click** inside the **Experts** folder → *Paste* to drop your **.ex5** (or **.exe**) file.

MQL5 → Experts folder — DrTradeScalperPro file pasted

- **Fully close MetaTrader 5.**
- **Restart MetaTrader 5:** the robot will appear in *Navigator* → *Expert Advisors*, ready to be dragged onto a chart.

i If the robot does not show up after restart, make sure the file was pasted into **Experts** (not *Indicators* or *Scripts*), then right-click *Expert Advisors* in the *Navigator* → *Refresh*.

3-minute startup

1. Open the chart of the instrument you want to trade

In MT5, open the symbol (e.g. Step Index, Boom 1000, EURUSD, BTCUSD...) on M5 (5 minutes).
Right-click → *Template* if you want to apply your usual visual template — the robot adapts automatically.

2. Drag the robot onto the chart

From the *Navigator* → *Expert Advisors* → drag **DrTradeScalperPro** onto the chart. The settings dialog opens.

Figure 1 — The robot in the MT5 Navigator panel, ready to be dragged onto the chart.

3. Confirm the parameters

Common tab: enable *Allow algo trading*. **Inputs** tab: tweak as needed (lot, magic, modes). Click OK.

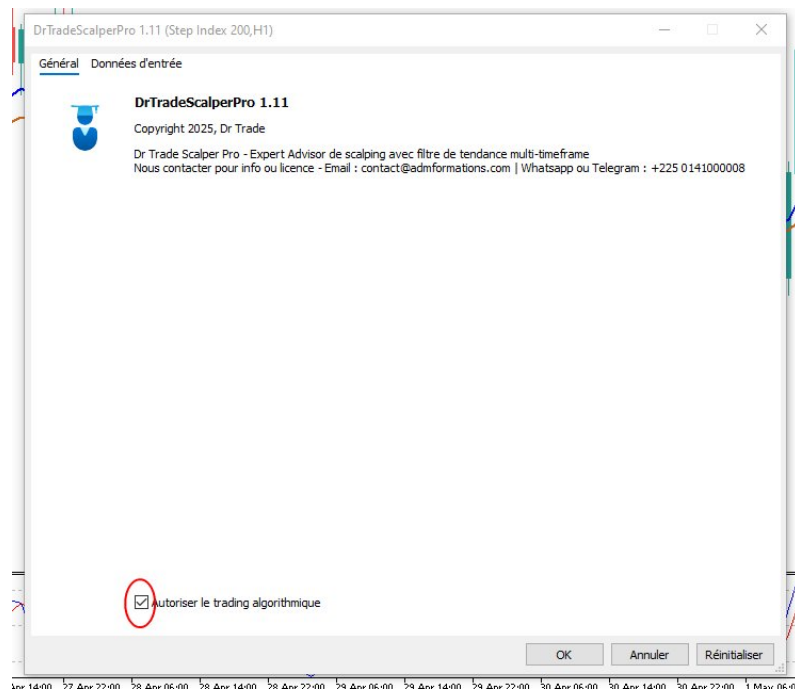

Figure 2 — « Inputs » tab of the EA configuration dialog.

4. Check the on-chart panel

An information panel appears in the top-right of the chart: Auto Trading status, strategy mode, trend filter state, and per-position thresholds.

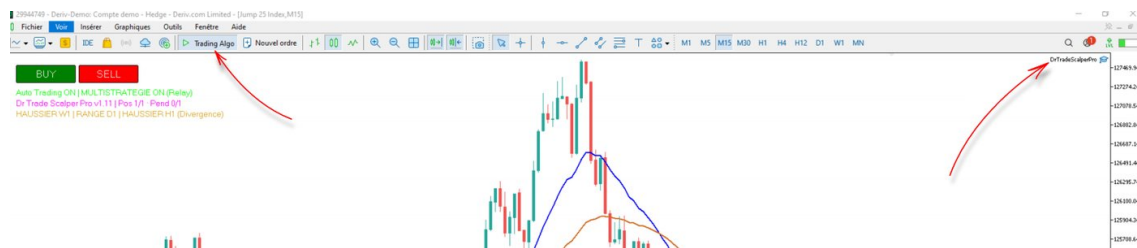

Figure 3 — Information panel displayed on-chart by the EA.

Tip If the panel is missing, ensure **Auto Trading** is ON and the EA smiley face is **blue** (not red).

Reading the on-chart panel

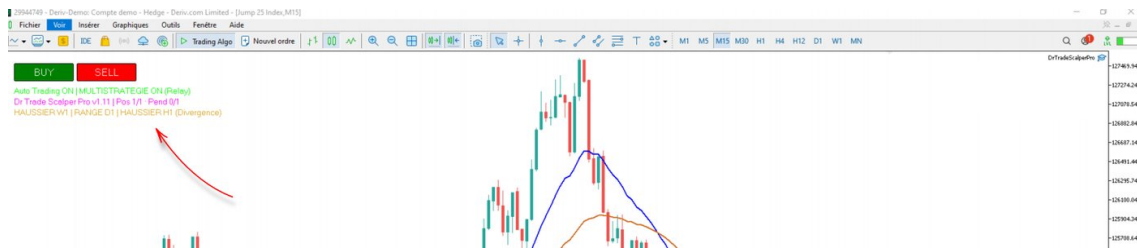

Figure 4 — Annotated on-chart panel: locate each section.

Top banner

- **Auto Trading ON / OFF** — whether the robot is allowed to trade.
- **MULTISTRATEGIE ON (Race)** or **(Relay)** — how the four internal strategies (STOKY, YAO, MCB, CRT) are combined.
- **Pos / Pend** — number of open positions and pending orders.

Trend filter

A line shows the trend alignment: **BULLISH W1 | BULLISH D1 | BULLISH H1 (Convergence 3/3 ✓)**. The robot only opens trades in the direction of the convergence.

Per-position thresholds

- **TMP** — recent position (under evaluation).
- **DEF** — definitive position (secured handling engaged).
- **[CLEAN]** — intelligent close-out procedure active on this position (the robot is trying to reduce the loss).

i You don't have to do anything manually. These markers are for your information. The robot handles everything automatically.

Parameters to configure

Below are the essential parameters you may want to adjust. All others are calibrated internally and require **no modification**.

ID & lot management

Parameter	Value	Purpose
Magic_Number	777001	Unique robot ID. Change it if you run 2 instances on different charts (e.g. 777002, 777003).
Fixed_Lot	0.20	Lot size per trade. Adjust to your capital (e.g. 0.05 for 100 USD, 0.20 for 500 USD, 0.50 for 1000 USD).
Quick_TP_Target_Dollars	10.0	Quick profit target in USD per trade. Since v1.23 : the QTP is <i>swap-aware</i> — it accounts for accrued swap and commission so that the net realised profit is at least equal to this target (never less). If swap is positive, behaviour is unchanged; if negative, the close is delayed until the price profit covers the carry cost.

Strategy mode

Parameter	Value	Purpose
Cohabitation_Mode	Race / Relay	Race : all four strategies (STOKY, YAO, MCB, CRT) run in parallel; the first valid signal wins the trade. Relay (v1.23) : priority cascade YAO → STOKY → MCB → CRT — each strategy can only trade if no higher-priority (enabled) strategy has an active trade. YAO only leads if the MTF is convergent.
Enable_Auto_Trading	true	Master switch. Set to false to halt all new trade openings and automatic management. Display and Quick TP remain active.

Allowed markets

The robot supports Synthetic Indices (Step Index, Boom, Crash, Jump, Volatility...), major Forex pairs and major Crypto. If your broker uses special suffixes (e.g. *BTCUSD.m*, *EURUSD-pro*), configure them in the parameters.

Trading hours

Parameter	Value	Purpose
Trading_Start_Hour	0	Start hour (0-23). 0 = no restriction.
Trading_End_Hour	23	End hour (0-23). 23 = no restriction.
Use_Time_Filter	false	Set to true to activate the time restriction.

Tip On Synthetic Indices (Deriv), you can leave **Use_Time_Filter = false**: these markets quote 24/7 with no weekend pause.

Telegram notifications

Figure 5 — Example of Telegram notifications sent by the robot.

Parameter	Value	Purpose
Telegram_Token	(your token)	Create a bot via @BotFather → /newbot → save the token (format: 123456789:ABCdef...).
Telegram_Chat_ID	(your chat ID)	Start a chat with your bot, then retrieve the chat ID via @userinfobot or the Telegram API.
Use_Telegram	true	Enables notification sending. Set to false to mute.

i For the **illustrated step-by-step procedure** to create a Telegram bot (via **@BotFather**), retrieve your **personal Chat ID** (via **@userinfobot**), and obtain a **group Chat ID** (via **@RawDataBot**), please refer to the document *Configuration Panel Guide v1.23*, section **10. Telegram Notifications** (sub-sections 10.1, 10.2 and 10.3).

Warning For notifications to work, allow the URL <https://api.telegram.org> in MetaTrader 5 → *Tools > Options > Expert Advisors > Allow WebRequest for listed URLs*.

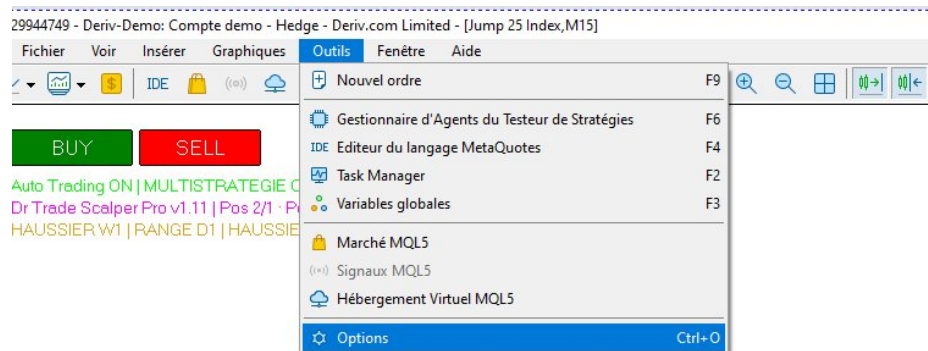

Figure 5b — Opening the Options window: Tools → Options menu (shortcut Ctrl + O).

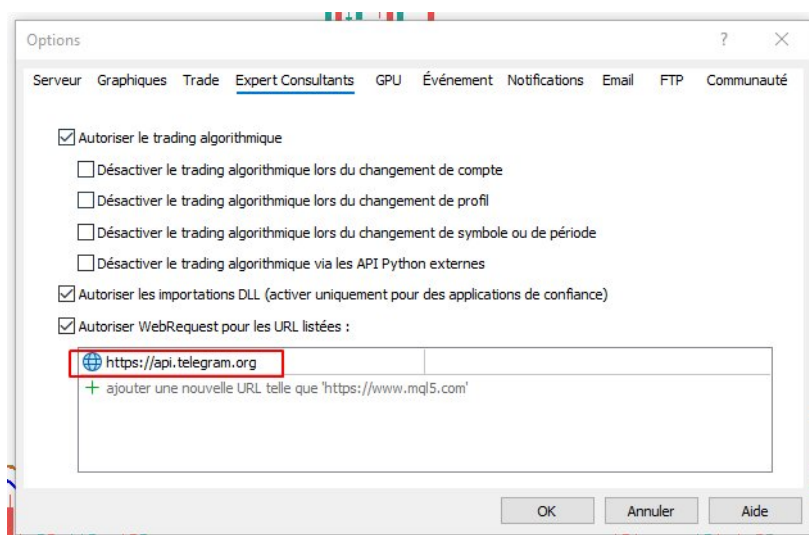

Figure 6 — Expert Advisors tab: enable Allow WebRequest and add <https://api.telegram.org>.

v1.23 parameters — Protection & Goals

Version 1.23 introduces three protection/goal modules you can enable based on your personal strategy:

Daily Profit Target — Daily goal

Parameter	Value	Purpose
Enable_Daily_Profit_Target	false	Set to true to stop opening new trades once the profit target is reached. Open positions keep being managed normally.
Daily_Profit_Target_Dollars	200.0	Profit target in USD.
Daily_Profit_Target_Scope	All symbols	Scope: All symbols (global account) or Current symbol (per instance).

i A Telegram notification is sent as soon as the target is hit. Automatic reset at midnight (MT5 server time).

Friday Auto-Pause

Parameter	Value	Purpose
Enable_Friday_Auto_Pause	false	Set to true to automatically pause the robot on Friday (avoids weekend gaps on Forex).
Friday_Pause_Hour_GMT	15	GMT start hour of the pause. E.g. 15 = 3pm GMT (good for closing before NY close).
Friday_Pause_Minute_GMT	0	Extra minute offset.

Daily Bias Pause

Parameter	Value	Purpose
Enable_Daily_Bias_Pause	false	After the first profitable trade closes, pauses new trade openings for X hours. Protects morning gains.
Daily_Bias_Pause_Hours	2.0	Pause duration in hours (decimals accepted: 0.5 = 30 min, 1.0 = 1h).

Compound-friendly QTP

Parameter	Value	Purpose
QTP_Scale_With_Lot	true (New v1.23)	When compound interest raises the lot above <i>LotSize</i> , the QTP target USD is scaled proportionally ($\times \text{lot} / \text{LotSize}$). The equivalent pip distance stays constant. Never scales down — smaller manual trades keep the fixed target.

Tip Example: $\text{LotSize}=0.20$ with $\text{Quick_TP}=25$ USD ≈ 125 pips. If compound raises the lot to 0.25, the target auto-scales to 31.25 USD (still ≈ 125 pips).

Best practices

Recommended capital

- Lot 0.05 → minimum recommended: **100 USD**
- Lot 0.10 → minimum recommended: **250 USD**
- Lot 0.20 → minimum recommended: **500 USD**
- Lot 0.50 → minimum recommended: **1,500 USD**

VPS hosting

For 24/7 operation (especially on Synthetic Indices), host your MT5 on a Windows VPS. This avoids interruptions caused by your personal PC (sleep mode, internet drops, restarts).

Discipline

- Let the robot run — don't intervene manually on its trades.
- Check the panel 1-2 times a day, not constantly.
- On significant drawdown, set **Enable_Auto_Trading = false** (no new trades) and analyse later in a calm state.

Recommended brokers

- **Deriv (deriv.com)** — access to exclusive Synthetic Indices.
- **IC Markets / FBS / Exness** — for Forex, Crypto and Metals.
- Always use an **MT5 Hedge** account (not Netting).

Stopping, disabling, removing

Pause without breaking anything

Set **Enable_Auto_Trading = false** in the EA properties. The robot still shows the panel and Quick TP but no longer opens new trades.

Fully disable

Click the **Auto Trading** button in the MT5 toolbar (it turns red). The EA is frozen until reactivation.

Remove from chart

Right-click the chart → *Expert Advisors* → *Remove*. Important: **close any open positions manually first** if you don't want them left unmanaged.

Warning If you remove the EA while a position is open, MT5 will NOT close the position. It becomes a regular manual position.

FAQ

The robot is not placing trades

- Check: **Auto Trading ON** (top of MT5).
- Check: the EA smiley is **blue** (not red).
- Check: **Enable_Auto_Trading = true** in parameters.
- The robot may be waiting for trend convergence (3/3 on the MTF filter) and a valid signal. This is normal in flat markets.
- A cooldown may be active after a recent trade.

Auto Trading turned off by itself

MT5 sometimes disables Auto Trading after a crash, an update, or a connection loss. Re-enable the button and you're back.

How do I switch instruments?

Drag the robot onto the new chart. **Change the Magic Number** if you want both instances running in parallel (e.g. 777001 on Step Index, 777002 on Boom 1000).

How do I switch demo / live?

In MT5: *File* → *Login to Trade Account*. The EA automatically follows the new account.

Risk warning

Warning Trading carries substantial risk of loss. Past performance does not guarantee future results. Dr Trade Scalper Pro is an automated decision-support tool: responsibility for outcomes lies with the user. Trade only with capital you can afford to lose.
